DE SVMMO VSV CALCVLI IMAGINARIORVM

= (25)

IN ANALYSI.

Auctore L. EVLERO.

Conuent. exhib. d. 18 Mart. 1776.

uanta incrementa Calculo Imaginariorum per vniuerfam Analyfin accepta fint referenda, nunc quidem amplius nemo dubitabit. Nuper equidem conatus fum integrationem formularum rationalium a Calculo Imaginariorum penitus liberare; veruntamen hoc negotium in cafibus, vbi denominator plures habet factores inter fe aequales, minus feliciter fucceffit. Quin etiam non ita pridem in tales formulas integrales incidi, quae quomodo fine fubfidio Imaginariorum tractari queant, nullo adhuc modo perfpicio. Cum enim (*) oftendiffem, huius formulae integralis: $\int \frac{\partial x}{x} \cdot \frac{x^p + x^{-p}}{x^n + 2 \operatorname{cof} \theta + x^{-n}}$, valorem a termino x=0vsque ad x=1 extendum effe $\frac{\pi \operatorname{fin} \cdot \frac{\theta p}{\pi}}{n \operatorname{fin} \cdot \theta \operatorname{fin} \cdot \frac{\pi p}{\pi}}$, denotante π peripheriam circuli cuius diameter = 1, inde facile deducitur haec conclufio maxime memorabilis: quod huius formulae integralis

(*) Vid. Differtationem praecedentem pag. 20. Noua Acta Acad. Imp. Sc. T. III.

D

(26)

gralis: $\int \frac{\partial x}{x \, l \, x} \cdot \frac{x^p - x^{-p}}{x^n + 2 \, \operatorname{cof.} \theta + x^{-n}}$ valor, pariter a termino x = 0 vsque ad x = 1 extension, acquetur isti integrali:

$$\frac{\pi}{n\,\operatorname{fin.}\,\theta}\int\frac{\partial\,p\,\operatorname{fin.}\,\frac{\theta\,p}{n}}{\operatorname{fin.}\,\frac{\pi\,p}{n}},$$

vbi fcilicet quantitas p tanquam variabilis fpectatur, et integrale ita capitur, vt euanefcat pofito $p \equiv 0$. Quodfi ergo nunc faciamus $\frac{p}{n} \equiv \phi$, integrari oportet huiusmodi formulam differentialem: $\frac{2}{p} \phi fin. m \phi$. Quemadmodum igitur ifta integratio auxilio Imaginatiorum tractari debeat, hic fum oftenfurus.

De integratione formulae

 $\int \frac{\partial \Phi \, \text{fin.} \, m \Phi}{\text{fin.} \, n \, \Phi}.$

§. I. Ante omnia hanc formulam ad quantitates algebraicas ordinarias reuocari conuenit, id quod commodius quam per Imaginaria praestari nequit. Hunc in finem statuamus brenitatis gratia $t = cof. \phi + \gamma - i$ fin. ϕ et $u = cof. \phi - \gamma - i$ fin. ϕ , ita vt fit t u = i; tum vero erit

 $\partial t = - \partial \phi$ (fin. $\phi = \sqrt{-1}$ cof. ϕ) ideoque

 $\partial t \sqrt{-1} = -\partial \Phi(\operatorname{cof.} \Phi + \sqrt{-1} \operatorname{fin.} \Phi) = -t \partial \Phi,$

vnde ergo fiet

 $\frac{\partial \phi}{\partial t} = \frac{\partial t}{t} = \frac{\partial t}{t} \cdot \frac{\partial t}{\partial t}$

§. 2. His autem formulis constitutis, ex elementis Calculi Imaginariorum constat esse

 $t^{\lambda} \equiv \operatorname{cof.} \lambda \Phi + \gamma - \mathrm{I} \operatorname{fin.} \lambda \Phi \operatorname{et}$ $u^{\lambda} \equiv \operatorname{cof.} \lambda \Phi - \gamma - \mathrm{I} \operatorname{fin.} \lambda \Phi;$

wnde

vnde ergo colligitur $t^{\lambda} - u^{\lambda} \equiv 2 \sqrt{-1}$ fin. $\lambda \Phi$, ideoque

fin.
$$\lambda \phi = \frac{t^{\lambda} - u^{\lambda}}{2 \sqrt{-1}}$$
.

Hinc ergo fi loco λ fcribamus numeros *m* et *n*, erit

 $\frac{\operatorname{fin.} m \, \Phi}{\operatorname{fin.} n \, \Phi} = \frac{t^m - u^m}{t^n - u^n},$

quocirca, fi integrale quaefitum littera S defignemus, vt fit $S = \int \frac{\partial \Phi fin. m \Phi}{fin. m \Phi}$, facta fubfitutione nunc habebimus

$$\partial S = \frac{\partial t}{t \sqrt{-1}} \cdot \frac{t^m - u^m}{t^n - u^n}$$

Quia autem est $u = \frac{1}{t} = t^{-1}$, formula proposita ad speciem confuetam, folam variabilem t involuentem, est reducta, cum sit

$$\partial S \gamma' - \mathbf{I} = \frac{\partial t}{t} \frac{t^m - t^{-m}}{t^n - t^{-m}},$$

cuius formulae adeo integralis iam passim euoluta reperitur. Hic autem probe meminisse oportet, ipsam quantitatem t non effe realem, cum fit $t = cof. \phi + \gamma - \tau$ fin. ϕ .

§. 3. Manifestum hic est ambos numeros m et n femper tanquam integros spectari posse, cum iis ratio indicetur, quam ambo anguli $m \oplus$ et $n \oplus$ inter se tenent. Hic igitur ante omnia dispiciendum erit, vtrum exponens m maior minorue sit exponente n; quandoquidem notum est, si fuerit m > n, fractionem nostram esse special successful fuerit m > n, fractionem nostram esse special successful fuerit m > n, fractionem nostram esse special successful fuerit m > n, fractionem nostram esse special successful fuerit m > n, fractionem nostram esse special successful fuerit m > n, fractionem nostram esse special successful fuerit m > n, fractionem nostram esse special successful fuerit m > n, fractionem nostram esse special successful fuerit m > n, fractionem nostram esse special successful fuerit m > n, fractionem nostram esse special successful fuerit m > n, ita tamen vt sit $\lambda < n$, ac facile patebit, fractionem $\frac{t^{n+\lambda} - t^{-(n+\lambda)}}{t^n - t^{-n}}$ continere partem integram $t^{\lambda} + t^{-\lambda}$, qua ab ista fractione sub-D 2 lata

(28)

lata remanet $\frac{t^n - \lambda - t^{-(n-\lambda)}}{t^n - t^{-n}}$, quae fractio non amplius eff spu-Ex parte integra autem ducta in $\frac{\partial t}{t}$ oritur integrale ria. $\frac{t^{\lambda}-t^{-\lambda}}{2}. \quad \text{At vero eff } t^{\lambda}-t^{-\lambda}\equiv t^{\lambda}-u^{\lambda}\equiv 2\sqrt{-1} \text{ fin. } \lambda \Phi,$ quod per $\sqrt{-1}$ divifum dat partem integralis hinc oriundam $\frac{1}{\lambda} = \frac{2 \operatorname{fin}^2 \lambda \Phi}{\lambda}.$

§. 4. Sin autem fuerit $m \ge 2n$, fiue $m = 2n + \lambda$, tum fractio nostra $\frac{t^{2n} + \lambda - t^{-2n} - \lambda}{t^n - t^{-n}}$ hanc continebit partem integram: $t^{n+\lambda} + t^{-n-\lambda}$, qua ablata remanet adhuc ifta fractio: $t^{\lambda} - t^{-\lambda}$ $\frac{t-t}{t^n-t^{-n}}$, quae iam est genuina ob $\lambda < n$. At vero ex parte integra ducta in $\frac{\partial t}{t}$, oritur integrando $\frac{t^{n+\lambda}-t^{-n-\lambda}}{n+\lambda} = \frac{t^{n+\lambda}-u^{n+\lambda}}{n+\lambda},$

cuius valor eft: $\frac{2\sqrt{-1} fin. (n+\lambda)\Phi}{n+\lambda}$, qui per $\sqrt{-1}$ diuifus praebet partem integralis hinc natam $= \frac{2 \int in.(n+\lambda) \Phi}{n+\lambda}$.

§. 5. Simili modo fi fuerit $m \ge 3n$, ac ponatur $m = 3n + \lambda$, fractio noftra erit $\frac{t^{3n+\lambda} - t^{-3n-\lambda}}{t^n - t^{-n}}$, quae continebit partem integram $t^{n+\lambda} + t^{-n-\lambda}$; hac autem ablata remanebit adhuc fractio $\frac{t^{n+\lambda}-t^{-n-\lambda}}{t^{n-1}}$; quae etiamnunc eft ípuria et continet partem integram $t^{\lambda} + t^{-\lambda}$, qua ablata demum remanet fractio genuina $\frac{t^n - \lambda}{t^n - t^{-n}}$. Ex partibus autem integris oriuntur hae partes integralis: $\frac{2 \int \ln (2\pi + \lambda) \Phi}{2\pi + \lambda} + \frac{2 \int \ln \lambda \Phi}{\lambda}$. **δ. δ**₃

(29)

§. 6. Ponamus quoque effe m > 4n, ideoque $m=4n+\lambda$, et fractio noftra erit $\frac{t^{+n-r\lambda}-t^{-4n-\lambda}}{t^n-t^{-n}}$, quae flatim continet partem integram $t^{3n+\lambda}+t^{-3n-\lambda}$, hac autem ablata remanet adhuc ifta fractio: $\frac{t^{2n+\lambda}-t^{-2n-\lambda}}{t^n-t^{-n}}$, quae denuo continet partem integram $t^{n+\lambda}+t^{-n-\lambda}$, qua fubtracta tandem remanet ifta fractio genuina: $\frac{t^{\lambda}-t^{-\lambda}}{t^n-t^{-n}}$. Iam vero ex partibus integris obtinentur pro integraii S iftae partes: $\frac{2 \sin (3n+\lambda)\Phi}{3n+\lambda}+\frac{2 \sin (n+\lambda)\Phi}{n+\lambda}$.

§. 7. Sit porro etiam m > 5 n, fiue $m = 5 n + \lambda$, ac noftra fractio $\frac{t^{5 n+\lambda} - t^{-5 n-\lambda}}{t^n - t^{-n}}$ primo continebit partem integram $t^{4 n+\lambda} + t^{-4n-\lambda}$, qua ablata remanet adhuc ifta fractio: $\frac{t^{3 n+\lambda} - t^{-3 n-\lambda}}{t^n - t^{-n}}$, quae per antecedentia continet adhuc duas partes integras, fcilicet $t^{2 n+\lambda} + t^{-2 n-\lambda}$ et $t^{\lambda} + t^{-\lambda}$, quibus ablatis remanet tandem ifta fractio genuina: $\frac{t^n - \lambda - t^{-(n-\lambda)}}{t^n - t^{-n}}$.

§. 8. Ex his cafibus iam fatis perfpicitur, quomodo, fi exponens n adhuc maior accipiatur, partes integrae in integrale S ingredientes fe fint habiturae, quas idcirco hic coniunctim afpectui exponamus.

II.

I. Si
$$m = n + \lambda$$
, erit $\int \frac{\partial \phi fin. (n+\lambda) \phi}{fin. n \phi} = \frac{2 fin. \lambda \phi}{\lambda} + \int \frac{\partial t}{t \sqrt{-1}} \cdot \frac{t^{n-\lambda} - t^{-(n-\lambda)}}{t^n - t^{-n}};$
D 3

$$= (30) = (30)$$

§. 9. His igitur cafibus, quibus m > n, felicifimo cum fucceffu expeditis, totum negotium reducitur ad integrationem formulae $\frac{\partial \Phi \sin m \Phi}{\beta m, n \Phi}$, pro cafibus quibus eft m < n; quandoquidem ex modo allatis manifestum est, quomodo illi cafus ad hos facillime reducuntur. Tum igitur ope nostrae substitutionis $x = cos \Phi + \gamma - x sin \Phi$ peruenitur ad hanc formulam:

$$S \gamma - \mathbf{I} = \int \frac{\partial t}{t} \cdot \frac{t^m - t^{-m}}{t^n - t^{-n}},$$

cuius ergo integrationem data opera instituamus.

Inue-

Inuestigatio integralis

 $\frac{\partial t}{dt} \cdot \frac{t^m - t^{-m}}{t^m - t^{-m}}$

existente m < n.

§. 10. Hic ante omnia cunchi factores trinomiales nofiri denominatoris $t^n - t^{-n}$ indagari debebunt, quorum fingulorum forma ita exhiberi poteft: $t^1 - 2 \operatorname{cof.} \omega + t^{-1}$, vbi angulum ω ita definiri oportet, vt pofito $t^1 - 2 \operatorname{cof.} \omega + t^{-1} \equiv 0$ fimul ipfe denominator euanefcat; tum autem exinde colligitur $t \equiv \operatorname{cof.} \omega + \sqrt{-1}$ fin. ω , vnde flatim patet fore

 $t^n \equiv \operatorname{cof.} n \omega + \gamma' - \mathrm{r fin.} n \omega$ et

 $t^{-n} \equiv \operatorname{cof.} n \omega - \gamma - \mathbf{i} \operatorname{fin.} n \omega$

quamobrem nofter denominator reducetur ad hanc formam: $2\sqrt{-1}$ fin. $n\omega$, qui ergo valor nihilo debet aequari.

§. 11. Cum igitur debeat effe fin. $n \omega \equiv 0$, omnes valores, quos pro $n \omega$ accipere licet, erunt $\circ \pi$, π , 2π , 3π , 4π , etc. vnde ipfius anguli ω valores erunt $\frac{\circ \pi}{n}$, $\frac{i\pi}{n}$, $\frac{i\pi}{n}$, $\frac{i\pi}{n}$, $\frac{i\pi}{n}$, etc. et in genere $\frac{i\pi}{n}$, denotante *i* numerum integrum quemcunque. Hinc igitur pro omnibus factoribus nostri denominatoris videntur capi debere n horum valorum; verum manifestum est, quotcunque tales formulae $t^{1} - 2 \operatorname{cof.} \omega + t^{-1}$ in fe inuicem multiplicentur, vltimum terminum nunquam prodire pose $-t^{-n}$. At vero hic meminisse oportet, quae circa huiusmodi integrationes in genere fust praecepta: scilicet talem factorem trinomialem $tt - 2t \cos \omega + 1$, cafu quo $\omega \equiv 0$, non factorem quadratum $(t-1)^2$, fed tantum fimplicem t-1 innui, quod idem quoque euenit fi $\omega \equiv \pi$, tum enim quoque non factor quadratus $(l+1)^2$, fed tantum fimplex $i \rightarrow i$ eff fumendus, quare cum hi ipfi casus inter valores ipfius & occurrant, necesse est vt numerus ho-

horum factorum vnitate augeatur. Hic autem commode vfu venit, vt isti casus ex valoribus $\omega \equiv 0$ et $\omega \equiv \pi$ oriundi e medio tollantur.

§. 12. Cum igitur fractionem noftram
$$\frac{1}{m}$$
 in

meras fractiones fimplices refolui oporteat, quarum denominatores fint $t^{1} - 2 \operatorname{cof.} \omega + t^{-1}$, pro vnaquaque harum fractionum ftatuamus

$$\frac{t^m - t^{-m}}{t^n - t^{-n}} = \frac{\Delta}{t - 2 \operatorname{cof.} \omega + t^{-1}} + R$$

vbi R complectatur omnes reliquas fractiones, et nunc vtrinque multiplicemus per $t - 2 \operatorname{cof.} \omega + t^{-1}$, vt prodeat

$$\frac{(t^m-t^{-m})(t-2\cos(\omega+t^{-1}))}{t^n-t^{-n}} = \Delta + R(t-2\cos(\omega+t^{-1}));$$

vnde fi iam ponamus $t - 2 \operatorname{cof.} \omega + t^{-1} = 0$, quod fit fumendo $t = \operatorname{cof.} \omega + \sqrt{-1}$ fin. ω , hinc colligitur numerator noftrae fractionis

$$\Delta \equiv (t^m - t^{-m}) \frac{t - 2 \operatorname{cof.} \omega + t^{-1}}{t^n - t^{-n}}$$

Tum autem manifestum est in hac fractione, ad quam sum deducti, hoc casu tam numeratorem quam denominatorem in nihilum abire, vnde iuxta regulam notifiimam corum loco sua foribamus differentialia, atque ista fractio induet hanc formam: $\frac{t^{r}-t^{-r}}{n(t^{n}+t^{-n})}$, vbi manifesto erit $t-t^{-r} \equiv 2 \sqrt{-r}$ i fin. ω , at $t^{n}+t^{-n} \equiv 2 \operatorname{cof.} n \omega$, ita vt nunc valor huius fractionis futurus fit $\frac{\sqrt{-r} \sin \omega}{n \cos n \omega}$, qui ductus in $t^{m}-t^{-m} \equiv 2 \sqrt{-r}$ i fin. $m \omega$ dabit numeratorem noftrum quaesitum $\Delta \equiv -\frac{2 \sin \omega \sin m \omega}{n \cos n \omega}$. Quia

Quia autem est fin. $n \omega \equiv 0$, semper erit vel cos. $n \omega \equiv 1$, vel cof. $n \omega = -i \pi$, provti, flatuendo in genere $\omega = \frac{i \pi}{n}$, numerus i fuerit vel par, vel impar.

(3.3.)

§. 13. Inuenta igitur hac fractione: $-\frac{\pi \int in.\omega \int in.m\omega}{u co \int .u\omega}$, ea in $\frac{\partial t}{t}$ multiplicetur et integretur, ficque ad istam pertingimus formulam integralem:

$$\frac{2 \text{ fin. } \omega \text{ fin. } m \omega}{n \operatorname{cof. } n \omega} \cdot \frac{\partial t}{t} \cdot \frac{1}{t - 2 \operatorname{cof. } \omega + t^{-1}}$$

cuius quidem integratio nulla amplius laborat difficultate: perduceret enim ad arcum circuli cuius tangens $= \frac{t \int in.\omega}{r \to t coj.\omega}$; verum quia ipfa quantitas t iam est imaginaria, hinc parum lucraremur, quoniam necesse foret istum arcum imaginarium ad quantitates reales reducere, fiquidem constat, arcus imaginarios ad logarithmos reales reduci.

§. 14. Vt igitur hunc laborem euitemus, loco noftrae variabilis t ipfum angulum \oplus rurfus in calculum reuocemus, et quia iam vidimus e'e $\frac{\partial t}{t} \equiv \partial \oplus \sqrt{-1}$, tum vero t + u $\equiv 2 \operatorname{col} \oplus$, hisce valoribus fubfitutis formula integranda erit $-\frac{\operatorname{fin} \cdot \omega \int n \cdot m \omega}{h \cdot cy + u} \cdot \frac{\partial \oplus \sqrt{-1}}{cy + \omega}$, quae formula per $\sqrt{-1}$ diuifa praebet partem ipfius integralis quaefiti S, ita vt fit

 $S = - \frac{fin. \omega / in. m \omega}{n co_{j}. n \omega} \int \frac{\sigma \Phi}{coj. \Phi - cof. \omega},$

fiquidem angulo ω fucce fue omnes fuos valores tribuamus; vbi per fe manifestum est, in hac integratione angulum ω esse constantem folumque Φ variabi em.

§. 15. Ex coëfficiente huius formulae statim patet, quod iam supra innuimus, ex valoribus ipsius ω primo et extremo, scilicet $\omega = 0$ et $\omega = \pi$, partes integralis sponte e me-Neua Acta Açad. Imp. Sc. T. III. E dio **____** (34) **____**

dio tolli, ita vt nunc fufficiat loco ω fucceffiue fubfitui hos valores: $\frac{\pi}{n}$, $\frac{2\pi}{n}$, $\frac{3\pi}{n}$, $\frac{(n-1)\pi}{n}$. Vbi recordandum, dum flatuitur $\omega = \frac{i\pi}{n}$, quoties *i* fuerit numerus par, fore cof. $n\omega =$ + 1; fin autem fit *i* numerus impar, tum fore cof. $n\omega = -1$. Quibus obferuatis totum negotium reductum eft ad integrationem huius formulae fatis memorabilis: $\int \frac{2\Phi}{cof.\Phi - cof.\omega}$.

§. 16. Facile quidem foret istam formulam ad quantitates reales confuetas reuocare; interim tamen fequenti modo haec integratio facilius et elegantius abfolui potest. Ponamus enim breuitatis gratia $\frac{\partial \Phi}{\cos(\Phi - \cos(\omega))} = \partial s$, et fecundum calculum angulorum iam fatis vulgatum nouimus esse

cof. $\phi = -\cos \omega = 2 \sin \frac{\omega + \phi}{2} \cdot \sin \frac{\omega - \phi}{2}$

ficque habebimus:

$$\partial s = \frac{\partial \Phi}{2 \operatorname{fin.} \frac{\omega + \Phi}{2} \operatorname{fin.} \frac{\omega - \Phi}{2}}, \text{ fine}$$

 $\frac{2 \partial s}{\partial \Phi} = \frac{r}{\operatorname{fin.} \frac{\omega + \Phi}{2} \cdot \operatorname{fin.} \frac{\omega - \Phi}{2}},$

quae fractio, quia denominator duobus constat factoribus, commode resolui potest in duas stractiones huiusmodi :

$$\frac{1}{\operatorname{fin.}\frac{\omega+\Phi}{2}} + \frac{\beta \operatorname{cof.}\frac{\omega-\Phi}{2}}{\operatorname{fin.}\frac{\omega-\Phi}{2}},$$

vbi flatim patet fumi debere $\beta \equiv \alpha$, tum enim fumma harum fractionum prodit $\frac{\alpha \text{ fin. } \omega}{\text{fin. } \frac{\omega + \Phi}{2} \text{ fin. } \frac{\omega - \Phi}{2}}$, vnde $\alpha \equiv \beta \equiv \frac{1}{fin. \omega}$. Hinc autem erit $\partial s \equiv -\frac{1}{2} \left(\frac{\partial \Phi \text{ cof. } \omega + \Phi}{2} + \frac{\partial \Phi \text{ cof. } \frac{\omega - \Phi}{2}}{G - \omega} \right)$,

$$s = \frac{1}{2 \operatorname{fin} \cdot \omega} \cdot \left(\frac{\varphi + \varphi}{\operatorname{fin} \cdot \frac{\omega + \varphi}{2}} + \frac{1}{\operatorname{fin} \cdot \frac{\omega - \varphi}{2}} \right),$$

in

in quibus formulis numerator manifesto est differentiale denominatoris, vnde concludimus fore

 $s = \frac{1}{\text{fin. }\omega} / \frac{\text{fin. } \frac{\omega + \Phi}{2}}{\text{fin. } \frac{\omega - \Phi}{2}}.$

§. 17. Inuento iam hoc integrali, in quo cardo totius inuestigationis versabatur, quilibet factor denominatoris in valorem integralem quaesitum S ductus suppeditat istam partem:

$$-\frac{\operatorname{fin.} m \,\omega}{n \operatorname{cof.} n \,\omega} \cdot \int \frac{\operatorname{fin.} \frac{\omega + \Phi}{2}}{\operatorname{fin.} \frac{\omega - \Phi}{2}},$$

vbi tantum opus est vt loco anguli ω successive omnes eius valores debiti substituantur, tum enim aggregatum omnium harum formularum praebebit verum valorem integralis $S = \int \frac{\partial \Phi \int \sin m \Phi}{\int \sin n \Phi}$.

§. 18. Quo autem totum integrale fuccinctius repraefentare valeamus, ponamus breuitatis gratia $\frac{\pi}{n} = 2\alpha$, ita vtvalores ipfius ω futuri fint 2α , 4α , 6α , . . . $2(n-\tau)\alpha$; tum vero fit $\Phi = 2\Psi$, atque formulae integralis $\int \frac{2\partial \Psi fm \cdot 2m\Psi}{n fm \cdot 2n \Psi}$ valor completus erit

$$S = \frac{fin.\ 2\ m\ \alpha}{n} l \frac{fin.\ \alpha + \psi}{fin.\ \alpha - \psi} - \frac{fin.\ 4\ m\ \alpha}{n} l \frac{fin.\ 2\ \alpha + \psi}{fin.\ 2\ \alpha - \psi} + \frac{fin.\ 6\ m\ \alpha}{n} l \frac{fin.\ 3\ \alpha + \psi}{fin.\ 3\ - \psi} - \frac{fin.\ 8\ m\ \alpha}{n} l \frac{fin.\ 4\ \alpha + \psi}{fin.\ 4\ \alpha - \psi} + \frac{fin.\ 6\ m\ \alpha}{n} l \frac{fin.\ 5\ \alpha + \psi}{fin.\ 5\ \alpha - \psi} - \frac{fin.\ 7\ m\ \alpha}{n} l \frac{fin.\ 6\ \alpha + \psi}{fin.\ 6\ \alpha - \psi},$$

donec horum membrorum numerus fit n-1. Haec autem formula tantum valet quando m < n: fi enim fuerit m > n, iam ante oftendimus, cuiusmodi termini infuper debeant adiungi.

§. 19. Hic observandum est haec integralia ita esse sumta, vt evanescant posito $\phi = 0$, quoniam hoc casu omnes E 2 logalogarithmi ad vnitatem referuntur. Deinde etiam euidens eft, fi angulus ψ augeatur vsque ad α , tum integrale iam in infinitum excressioner; vnde patet hunc angulum non vltra istum terminum augeri conuenire. Verum etiam cafus initio memoratus, qui ad hanc formulam integralem ducit, non postulat vt iste angulus vltra hunc terminum augeatur, quamobrem operae pretium erit integrationem inuentam ad hunc ipsum casum accommodare.

(36)

Problema, Valorem iftius formulae integralis: $\int \frac{\partial x}{x \, l \, x} \cdot \frac{x^p - x^{-p}}{x^n + 2 \, \text{cof. } \theta + x^{-n}},$

a termino $x \equiv 0$ ad $x \equiv 1$ extension, per expressionem finitam assignare.

Solutio.

§. 20. Quoniam iftum valorem quaefitum reduxi ad hanc formulam integralem: $\frac{\pi}{n \text{ fin. } \theta} \int \frac{\partial p \text{ fin. } \frac{\theta p}{\pi}}{\text{ fin. } \frac{\pi p}{\pi}}$, primum tenendum eft, eum finite exprimi non posse, nifi angulus θ ad π habeat rationem rationalem. Ponamus ergo hanc rationem esse $\theta: \pi = \mu: \nu$, ita vt μ et ν fint numeri integri, quamobrem pro formula ante tractata statuamus $m = \mu$ et $n = \nu$, vnde fiet angulus $\nu \Phi = \frac{\pi p}{\pi}$. Ponamus hic breuitatis gratia $\frac{p}{\pi} = r$, vt habeamus $\Phi = \frac{\pi r}{\nu}$, et valor, quem quaerimus, ob p = nr, erit $\frac{\pi}{fin.\theta} \int \frac{\partial r fin.\theta r}{fin.\pi r}$, quare cum hinc fiat $\Phi = \frac{\pi r}{\nu}$, formula fupra tractata $\int \frac{\partial \Phi fin m \Phi}{fin.\pi \Phi}$ abibit in hanc: $S = \frac{\pi}{\nu} \int \frac{\partial r fin.\frac{\mu \pi r}{\nu}}{fin.\pi r}$, ficque valor, quem hic quaerimus, erit $\frac{\nu.s}{fin.\theta}$, ita vt tantum opus fit valorem ipfius S pro hoc casu evoluere.

S. 21.

(37) ====

§. 21. Confideremus nunc primum valorem ipfius ω, qui erat $\omega = \frac{\pi}{\pi} = \frac{\pi}{\sqrt{2}}$, qui pro S produxit partem integralem

 $\frac{\operatorname{fin.} m \,\omega}{n \, \operatorname{cof.} n \,\omega} / \operatorname{fin.} \frac{\omega + \Phi}{\operatorname{fin.} \frac{\omega}{2}},$

erit hic $m\omega = \frac{\mu\pi}{r} = \theta$ et cof. $n\omega = -1$; tum vero

$$\omega + \Phi \equiv \frac{\pi}{r} (\mathbf{1} + r)$$
 et $\omega - \Phi \equiv \frac{\pi}{r} (\mathbf{1} - r);$

Primum igitur hic fumi debet angulus $\frac{\pi}{2\gamma}$, quem breuitatis gratia ponamus $= \varrho$, vt fit $\varrho = \frac{\pi}{2\nu}$, et prima pars nostrae formulae S erit $\frac{fin.\theta}{v} l_{fin.\theta(1-r)}^{fin.\theta(1+r)}$; fequentes autem partes erunt

$$\frac{-\int \frac{\sin 2\theta}{\gamma} \int \frac{\int \ln \theta(2+r)}{\int \ln \theta(2-r)};}{\frac{1}{\gamma} \int \frac{\int \ln \theta(3+r)}{\int \ln \theta(3-r)};}$$
etc.

quae partes ductae in $\frac{v}{\int in \cdot \theta}$ praebent ipfum valorem quem noftrum problema postulat, qui ergo erit

$$\frac{\int in.\theta}{\int in.\theta} \int \frac{\int in.e(1+e)}{\int in.\theta(1+e)} - \frac{\int in.2\theta}{\int in.\theta} \int \frac{\int in.e(2+r)}{\int in.e(2-r)} + \frac{\int in.3\theta}{\int in.\theta(3+e)} \int \frac{\int in.e(3+e)}{\int in.\theta(3+e)} - \frac{\int in.4\theta}{\int in.\theta} \int \frac{\int in.e(4+r)}{\int n.e(4-r)} \text{ etc.}$$

quae membra eo vsque continuari debent, donec eorum numerus fiat $\nu - 1$, vbi pro nostro problemate tantum notetur effe $r = \frac{p}{n}$ et $g = \frac{\pi}{2\gamma}$, existente $\theta : \pi = \mu : \nu$, fiue $\theta = \frac{\mu \pi}{\gamma}$, ita vt µ fit numerus integer. Cum igitur in formula propofita exponens p necessario minor fit quam n, erit r vnitate minor, ideoque omnes islae formulae finitae.

§. 22. Forma igitur generalis omnium partium, ex quibus hoc integrale conflat, eft $\pm \frac{fin.i\theta}{fin.\theta} l_{fin.\theta(i-r)}^{fin.\theta(i+r)}$, vbi fignum fuperius -- valet, quoties i fuerit numerus impar, inferius vero Ез

(38)

-, fi par. Pro vltima igitur harum partium erit i = v - r. Vbi probe notetur, fi fumeremus $i \equiv \nu$, partem hinc refultantem sponte esse euanituram, propterea quod $i e \equiv v e \equiv \frac{\pi}{2}$, ideoque ambo finus post logarithmum inter se aequales, ita vt perinde fit, fiue membrorum numerus flatuatur $\equiv v - 1$, fiue $\equiv v$.

Confideremus nunc vltimum membrum noftri 6. 23. valoris integralis, fumendo $i \equiv \nu - \tau$, vnde fiet fin. $(\nu - \tau) \theta$ = fin. $(\mu \pi - \theta)$, qui erit = fin. θ , fi μ fuerit numerus impar, fin autem μ fuerit numerus par, is erit = - fin. θ . Tum vero erit $i g \equiv (\nu - \mathbf{I})_{g} \equiv \frac{\pi}{2} - \frac{\pi}{2\nu}$, ideoque

 $\operatorname{fin}(\boldsymbol{v}-\boldsymbol{\mathbf{I}})_{g} \equiv \operatorname{fin}(\frac{\pi}{2}-g(\boldsymbol{\mathbf{I}}-r)) \equiv \operatorname{cof}(\boldsymbol{\mathbf{g}}(\boldsymbol{\mathbf{I}}-r)).$ Simili modo pro denominatore erit

 $\operatorname{fin}_{\ell}(i-r) \equiv \operatorname{fin}_{\mathfrak{T}}(\mathfrak{T}-\ell(\mathfrak{I}+r)) \equiv \operatorname{cof}_{\ell}(\mathfrak{I}+r);$ ita vt in vltimo membro cofinus eorundem angulorum occurrant, quorum finus occurrunt in primo membro, quae permutatio etiam reperietur in membro penultimo et secundo, tum vero etiam in antepenultimo et tertio, vnde bina huiusmodi membra in vnum coniungi poterunt.

Cafus I. ¥ p par.

Hic autem quatuor casus examinari conuenit, §. 24. par. prouti ambo numeri µ et v fuerint numeri vel pares vel im-Sint igitur primo ambo pares, vnde coefficiens vltimi pares. membri erit $+ \frac{\int in. \nu \pi - \theta}{\int in. \theta} = - \frac{\int in. \theta}{\int in. \theta}$, ideoque totum membrum vltimum $= - \frac{\int in. \theta}{\int in. \theta} \int \frac{cof. e(1 - r)}{cof. e(1 + r)}$, quamobrem primum membrum cum vltimo coniunctum dabit

 $\frac{\operatorname{fin.\theta}}{\operatorname{fin.\theta}} \mathcal{L}_{\operatorname{fin.e}(1-r)}^{\operatorname{fin.e}(1+r)} \cdot \frac{\operatorname{cof.e}(1+r)}{\operatorname{cof.e}(1-r)} \xrightarrow{=} \frac{\operatorname{fin.\theta}}{\operatorname{fin.\theta}} \mathcal{L}_{\operatorname{fin.e}(1-r)}^{\operatorname{fin.e}(1+r)}.$

Simili modo fecundum membrum et penultimum coalefcent in $\frac{fin.2\theta}{fin.2\theta} : \int_{\frac{fin.2\theta}{fin.2\theta}}^{\frac{fin.2\theta}{2}} : tum vero : etiam membrum tertium cum$

ante-

(39)

antepenultimo dabit $+ \frac{\int in.3\theta}{\int in.\theta} \int \frac{\int in.\theta}{\int in.\theta} dr$. Sicque de ceteris, ita ve hoc modo numerus membrorum ad semissem reducatur.

§. 25. Maneat nunc ν numerus par, fit vero μ nume- Cafus II. rus impar, eritque coëfficiens vltimi membri $\frac{fin,\theta}{fin,\theta}$, quod ergo ν parcum primo coniunctum dabit

 $+ \frac{\int in.\theta}{\int in.\theta} l \frac{\int in. e(1+r)}{\int in. e(1-r)} \cdot \frac{cof. e(1-r)}{cof. e(1+r)} - \frac{\int in.\theta}{\int in.\theta} l \frac{tang. e(1+r)}{tang. e(1-r)} \cdot$ Eodem modo membrum fecundum cum penultimo contrahetur in hanc formam: $-\frac{\int in. \theta}{\int in.\theta} l \frac{tang. e(a+r)}{tang. e(a-r)}$; at tertium membrum cum antepenultimo coniunctum dabit $\frac{\int in. \theta}{\int in.\theta} l \frac{tang. e(3+r)}{tang. e(3-r)}$.

§. 26. Sit nunc ν numerus impar, at μ numerus par, et Cafus III. ob priorem conditionem coëfficiens vltimi termini erit $-\frac{\int in. \mu \pi - \theta}{\int in. \theta}$, ν impar. qui ob μ numerum parem fiet $+\frac{\int in. \theta}{fin. \theta}$, ideoque vti in cafu fecundo, vnde etiam primum membrum cum vltimo iunctum dabit $\frac{\int in. \theta}{fin. \theta} I \frac{fang. e(1 + r)}{fang. e(2 + r)}$; fecundum vero cum penultimo iunctum $-\frac{\int in. 2\theta}{\int in. \theta} I \frac{fang. e(2 + r)}{fang. e(2 - r)}$; tum vero etiam tertium cum antepenultimo iunctum dat $\frac{\int in. 3\theta}{fang. e(3 - r)}$.

§. 27. Sint denique ambo numeri μ et ν impares, at-Cafus IV. que euidens est hunc casum ad primum este rediturum, ideo- ν impar. que primum et vltimum membrum contrahi in $\frac{fin. \theta}{fin. \theta} l \frac{fin. eq(1+r)}{fin. 2q(1-r)}$, μ impar. fecundum et penultimum in $\frac{fin. 2\theta}{fin. \theta} l \frac{fin. eq(2+r)}{fin. 2q(2-r)}$, tertium et antepenultimum in $\frac{fin. 3.\theta}{fin. \theta} l \frac{fin. eq(3+r)}{fin. eq(3-r)}$. Vnde patet hos quatuor cafus ad duos reduci posse, prouti ambo numeri μ et ν fuerint vel eiusdem indolis, scilicet ambo vel pares vel impares, vel diuersa indolis: alter par, alter impar. Priore casu eadem contractio locum habebit, quam casu primo dedimus, posteriore vero quam pro fecundo dedimus.

§. 28.

(40)

§. 28. Ex his intelligitur, fi numerus ν fuerit impar ideoque numerus membrorum primum inuentorum $\nu - 1$ par, tum omnia illa membra contrahi in numerum duplo minorem, fcilicet $\frac{\nu-1}{2}$. At vero fi ν fuerit numerus par, ob $\nu - 1$ imparem, facta illa contractione remanebit vnum membrum medium refpondens valori $i = \frac{\nu}{2}$, pro quo iste reperietur logarithmus:

$$\int \frac{\operatorname{fin.} \varrho\left(\frac{v}{2}+r\right)}{\operatorname{fin.} \varrho\left(\frac{v}{2}-r\right)} = \int \frac{\operatorname{fin.} \left(\frac{\pi}{4}+\varrho r\right)}{\operatorname{fin.} \left(\frac{\pi}{4}-\varrho r\right)}.$$

Quia igitur eft fin. $(\frac{\pi}{4} - \varrho r) \equiv cof. (\frac{\pi}{4} + \varrho r)$, euidens eft hoc cafu haberi $l \tan g. (\frac{\pi}{4} + \varrho r)$, coëfficiens autem erit $\pm \frac{fin. \frac{\nu}{2}\theta}{fin. \theta}$, vbi fignum fuperius valebit fi $\frac{\nu}{2}$ fuerit impar, inferius vero fi par. Eft vero fin. $\frac{\nu}{2}\theta = fin. \frac{\mu\pi}{2}$; vnde patet, fi fuerit μ numerus par, hoc membrum penitus e medio tolli; fin autem μ fuerit numerus par, tum fin. $\frac{\mu\pi}{2}$ erit vel $+ \tau$ vel $-\tau$. Ifta ambiguitas autem iam ante eft fublata. His notatis fequentia exempla fimpliciora percurramus; vbi notaffe iuuabit, numerum μ femper minorem effe debere quam ν , neque tamen fumi poffe $\mu = 0$.

§. 29. Quo autem euolutionem cafuum fpecialium faciliorem reddamus, denotet Σ formulam illam integralem, cuius valorem hactenus per partes euoluimus, ita vt fit

 $\sum = \frac{\pi}{\sin \theta} \int \frac{\partial r \sin \theta r}{\sin \pi r};$

tum igitur duos casus distingui conueniet, prouti ambo numeri μ et ν fuerint eiusdem vel diuersae indolis.

I. Sint μ et ν eiusdem indolis, eritque

 $\sum = \frac{fin. \theta}{fin. \theta} \int \frac{fin. 2 e(1+r)}{fin. 2 e(1-r)} - \frac{fin. 2 \theta}{fin. \theta} \int \frac{fin. 2 e(2-r)}{fin. 2 e(2-r)} + \frac{fin. 3 \theta}{fin. \theta} \int \frac{fin. 2 e(3+r)}{fin. 2 e(3-r)} - \frac{fin. 4 \theta}{fin. \theta} \int \frac{fin. 2 e(3-r)}{fin. 2 e(3-r)} etc.$

quas

____ (4I) ____

quas formulas non vltra multitudinem $\frac{\nu-1}{2}$ continuari necesse est; neque enim hic terminus medius locum habet: si enim fuerit ν numerus par, erit etiam μ par, ideoque termini medii coëfficiens euanescit.

II. Sint numeri μ et ν diversae indolis, vidimusque

 $\epsilon = \frac{1}{2}$

 $\sum \frac{\int in. \theta}{\int in. \theta} \int \frac{tang. \varrho(1+r)}{tang. \varrho(1-r)} \frac{\int in. \theta}{\int in. \theta} \int \frac{tang. \varrho(2+r)}{tang. \varrho(2-r)} \frac{\int in. \theta}{\int in. \theta} \int \frac{tang. \varrho(2-r)}{tang. \varrho(3+r)} - etc.$

quos terminos non vltra multitudinem $\frac{\nu-1}{2}$ continuari oportet. Hic autem, quoties ν numerus par, ideoque μ impar, occurret terminus medius, qui nunc vltimum locum occupabit, critque $\pm \frac{1}{fin.\theta} l$ tang. $(\frac{\pi}{4} + er)$, vbi fignorum ambiguitas fequitur alternationem fignorum. Ceterum hic vbique recordandum eft effe $e = \frac{\pi}{2\nu}$ et $\theta = \frac{\mu\pi}{\nu}$.

Exemplum I, quo $\nu = 2$. §. 30. Hic igitur erit $\varrho = \frac{\pi}{4} = 45^{\circ}$; at numerus μ neceffario eft = 1. Quia igitur $\frac{\nu - 1}{2} = \frac{1}{2}$, hic folus terminus, quem medium vocamus, occurrit, ita vt nunc habeamus

 $\Sigma = l \tan g. \frac{\pi}{4} (1 + r) = l \tan g. 45^{\circ} (1 + r),$ qui valor sponte ex forma generali deducitur, cum sit

$$\Sigma = \pi \int \frac{\partial r \, \text{fin.} \, \frac{\pi r}{2}}{\text{fin.} \, \pi r};$$

fore

eft vero fin. $\pi r = 2$ fin. $\frac{\pi r}{2}$ cof. $\frac{\pi r}{2}$, vnde fit

$$\Sigma = \frac{\pi}{2} \int \frac{\partial r}{\operatorname{cof.} \frac{\pi r}{2}} \, .$$

 $\Sigma =$

Quod fi iam ponamus $\frac{\pi r}{2} = \phi$, ob $\frac{\pi \partial r}{2} = \partial \phi$, erit Noua Acta Acad. Imp. Sc. T. III. F

(42)

$\Sigma = \int_{\frac{\partial \Phi}{c_{2} \int \Phi}} = l \tan(45^{\circ} + \frac{1}{2} \Phi).$

Reflituto ergo pro ϕ valore affumto crit $\Sigma = l \tan \theta \cdot 45^{\circ}(1+r)$, vti inuenimus.

Exemplum II, quo $\nu = 3$.

§. 31. Hic ergo erit $e = \frac{\pi}{5} = 30^\circ$, et quia $\frac{v-1}{2} = 1$, integrale noftrum vnico conflabit termino. Nunc autem numerus μ duos valores habere poteft: 1 et 2. Sit primo $\mu = 1$ hincque $\theta = \frac{\pi}{3} = 60$, et quia ambo numeri funt impares, ex cafu primo colligimus $\Sigma = l \int_{fin.60^\circ(1+r)}^{fin.60^\circ(1+r)}$. At fi fuerit $\mu = 2$ ideoque $\theta = 120^\circ$, quia numeri μ et ν habent disparia figua, ex cafu fecundo habebimus $\Sigma = l \frac{tang.30^\circ(1+r)}{tang.30^\circ(1-r)}$.

Exemplum III, quo $\nu = 4$.

§. 32. Hic ergo erit $q = \frac{\pi}{8} = 2\pi \frac{1}{2}^{\circ}$, et quia $\frac{\sqrt{-1}}{2} = 1\frac{1}{2}^{\circ}$, integrale vnico tantum membro integro conftabit, nisi forte terminus medius accedat, quemadmodum fingulis casibus pro μ assume as a second secon

1°. Sit igitur $\mu = 1$, erit $\theta = 45^\circ$ et $2\theta = 90^\circ$. Hinc ergo ob numeros μ et ν dispares, ex caíu fecundo habebimus

$$\Sigma = / \frac{\text{tang. } 22^{\frac{1}{2}^{\circ}}(1+r)}{\text{tang. } 22^{\frac{1}{2}^{\circ}}(1-r)} - \gamma 2 \cdot l \text{ tang. } 22^{\frac{1}{2}^{\circ}}(2+r).$$

2°. Sit $\mu = 2$, eritque $\theta = 90^\circ$ et $2\theta = 180^\circ$. Hinc ex casu primo nanciscimur $\Sigma = l \frac{\sin 45^\circ (1+r)}{\sin 45^\circ (1-r)}$. Cum autem fit

fin. $45^{\circ}(r-r) \equiv cof. 45^{\circ}(r+r)$,

euidens est fore $\Sigma = l \tan g. 45^{\circ} (1 + r)$, qui casus vique conuenit cum ratione $\mu : \nu = 1 : 2$.

ື

(43)

3°. At fi $\mu \equiv 3$, ideoque $\theta \equiv 135^\circ$ et $2\theta \equiv 270^\circ$, cuius anguli finus est — 1, ob figna disparia habebimus ex casu secundo:

$$\Sigma = \sqrt{\frac{\tan g. \ 22^{1^{\circ}}(1+r)}{\tan g. \ 22^{\frac{1^{\circ}}{2}}(1-r)}} + \sqrt{2.1 \tan g. \ 22^{1^{\circ}}(2+r)}.$$

Exemplum IV, quo v = 5.

§. 33. Hic ergo erit $g = 18^{\circ}$, et quia $\frac{y-1}{2} = 2$, integralia ex duobus membris integris constabunt, quia terminus medius, quem quasi dimidium spectamus, hic non occurrit.

1°. Sit $\mu \equiv 1$, eritque $\theta = 36^{\circ}$ et $2\theta = 72^{\circ}$; hinc ob ambo figna eadem casus primus nobis dat

$$\sum = I_{\frac{\sin 36^{\circ}(1+r)}{\sin 36^{\circ}(1-r)}}^{\frac{\sin 72^{\circ}}{\sin 36^{\circ}}} I_{\frac{\sin 36^{\circ}(2+r)}{\sin 36^{\circ}(2-r)}}^{\frac{\sin 36^{\circ}(2+r)}{\sin 36^{\circ}(2-r)}}.$$

2°. Sit $\mu \equiv 2$, eritque $\theta \equiv 72^\circ$, ideoque fin. $2\theta \equiv \text{fin. } 36^\circ$; vnde ob figna disparia cafus fecundus dat

 $\Sigma = l \frac{tang. 18^{\circ}(1+r)}{tang. 18^{\circ}(1-r)} - \frac{fin. 36^{\circ}}{fin. 72^{\circ}} l \frac{tang. 18^{\circ}(2+r)}{tang. 18^{\circ}(2-r)}.$

s°. Sit $\mu \equiv 3$, ideoque $\theta \equiv 108^\circ$, fiue fin. $\theta \equiv \text{fin. } 72^\circ$ et fin. $2\theta \equiv -\text{fin. } 36^\circ$; vnde ob figna paria cafus primus dat $\Sigma \equiv l \frac{\int in. 36^\circ(1+r)}{\int in. 36^\circ(1-r)} + \frac{\int in. 36^\circ}{\int in. 36^\circ(2-r)} l \frac{\int in. 36^\circ(2+r)}{\int in. 36^\circ(2-r)}$.

4°. Sit denique $\mu = 4$ et $\theta = 144^\circ$, hincque fin. $\theta = \text{fin. 36}^\circ$ et fin. $2\theta = -$ fin. 72° ; vnde ob figna disparia cafus II. praebet $\Sigma = l \frac{tang.18^\circ(1+r)}{tang.18^\circ(1-r)} + \frac{fin.72^\circ}{fin.36^\circ} l \frac{tang.18^\circ(2+r)}{tang.18^\circ(2-r)}$.

Exemplum V, quo $\nu = 6$.

§. 34. Hic igitur eft $g = \frac{\pi}{2} = 15^{\circ}$, et quia $\frac{\nu-1}{2} = \frac{\pi}{2}$, integralia duobus membris integris conftabunt, quibus accedere poteft terminus medius, fiue membrum dimidium, quando fcilicet μ eft numerus impar.

F 2

I°,

$$= (44) =$$

1°. Sit $\mu \equiv 1$, erit $\theta \equiv \frac{1}{2}\pi \equiv 30^{\circ}$, hinc fin. $\theta \equiv \frac{1}{2}$, fin. $2\theta \equiv \frac{\sqrt{3}}{2}$ et fin. $3\theta \equiv +1$; quare ob figna difparia fecundus casus nobis suppeditat $\Sigma = l \frac{tang. 15^{\circ}(1+r)}{tang. 15^{\circ}(1-r)} - \sqrt{3 \cdot l \frac{tang. 15^{\circ}(1+r)}{tang. 15^{\circ}(1-r)}} + 2 l tang. 15^{\circ}(3+r).$

2°. Sit $\mu = 2$, ideoque $\theta = 60^\circ$, vnde fit fin. $\theta = \frac{\sqrt{3}}{2}$, fin. $2\theta = \frac{\gamma'^3}{2}$ et fin. $3\theta = 0$; vnde ob figna paria ex cafu primo colligimus

 $\Sigma = l_{\frac{\sin . 30^{\circ} (1+r)}{\sin . 30^{\circ} (1-r)}} - l_{\frac{\sin . 30^{\circ} (2-r)}{\sin . 30^{\circ} (2-r)}},$

quae expressio perfecte acqualis prodiit ei quam supra inuenimus pro casu $\nu \equiv 3$ et $\mu \equiv 1$.

3°. Sit $\mu = 3$, ideoque $\theta = 90$, hinc fin. $\theta = 1$, fin. $2\theta = 0$ et fin. 3 $\theta = -1$; vnde ob figna disparia casus secundus nobis praebet

 $\Sigma = l \frac{tang. 15^{\circ}(1+r)}{tang. 15^{\circ}(1-r)} + * - l tang. 15^{\circ}(3+r), \text{ fine}$ $\Sigma = l \frac{t_{ang.15^{\circ}(1+r)}}{t_{ang.15^{\circ}(1-r)} t_{ang.15^{\circ}(3+r)}},$

quae expressio aequalis esse debet ei, quae in primo exemplo prodiit, quia vtroque casu est $\mu: \nu = 1:2$.

4°. Sit $\mu = 4$, ideoque $\theta = 120^{\circ}$, hinc fin. $\theta = \frac{\sqrt{3}}{2}$, fin. $2\theta = -\frac{\gamma_3}{2}$, fin. $3\theta = 0$; vnde ob figna paria casus primus praebet

$$\Sigma = l \frac{fin. 30^{\circ}(r+r)}{fin. 30^{\circ}(r-r)} + l \frac{fin. 30^{\circ}(r+r)}{fin. 30^{\circ}(r-r)},$$

quae conuenire debet cum superiore pro casu quo $\mu:\nu=2:3$.

Sit $\mu = 5$, ideoque $\theta = 150^\circ$, ergo fin. $\theta = \frac{1}{2}$, fin. $2\theta =$ $-\frac{\sqrt{3}}{2}$, fin. 3 $\theta = 1$; vnde ob figna disparia secundus casus nobis dat $\Sigma \equiv$

(45) ====

$\Sigma = l \frac{tang.15^{\circ}(1+r)}{tang.15^{\circ}(1-r)} + \sqrt{3} \cdot l \frac{tang.15^{\circ}(2+r)}{tang.15^{\circ}(2-r)} + 2 l tang. 15^{\circ}(3+r).$

Exemplum Vl, quo $\nu \equiv \infty$.

§. 35. Quia igitur fractio $\frac{\mu}{r}$ vt euanefcens fpectatur, ponamus $\mu \equiv 1$, ficque angulus θr prae πr euanefcet; vnde cum loco finuum angulorum θ et θr ipfos angulos ponere liceat, erit nofter valor $\Sigma = \frac{\pi \int r \, \partial r}{\int \pi \cdot \pi r}$. Deinde quia etiam angulus $\varrho = \frac{\pi}{2 \sqrt{r}}$ in nihilum abit, loco omnium finuum, in expressione pro Σ inuenta occurrentium, ipfos angulos foribere licebit, quo obferuato valor quantitatis Σ fequenti modo exprimetur:

 $l\frac{1+r}{1-r} - 2l\frac{2+r}{2-r} + 3l\frac{3+r}{3-r} - 4l\frac{4+r}{4-r} + etc.$

§. 36. Singuli hi logarithmi commode in feries refolui poffunt. Cum enim forma generalis omnium terminorum fit $i l \frac{i+r}{i-r}$, tum vero per notam refolutionem fit

 $l_{\frac{i+r}{i-1}}^{\frac{i+r}{i}} = \frac{2r}{i} + \frac{2r^{3}}{3i^{3}} + \frac{2r^{5}}{5i^{5}} + \frac{2r^{7}}{7i^{7}} + \text{etc.}$

erit totum membrum

 $= 2 r \left(1 + \frac{r r}{3 i i} + \frac{r^4}{5 i^4} + \frac{r^6}{7 i^6} + \text{etc.} \right)$

quamobrem fingulis partibus hoc modo euolutis fiet

$$\frac{\Sigma}{2r} = + I + \frac{rr}{3} + \frac{r^4}{5} + \frac{r^6}{7} + \frac{r^8}{9} + \text{etc.}$$

SPECIMEN SINGVLARE ANALYSEOS INFINITORVM

INDETERMINATAE.

Auctore

L. EVLERO.

Conuent. exhib. d. 18 Mart. 1776.

б. г.

am ante complures annos nouum prorsus Calculi genus advmbraui, cui Analyseos Infinitorum indeterminatae nomen inposueram, quoniam ad Analysin Infinitorum ordinariam eodem modo refertur, quo Analyfis Diophantea ad Algebram com-Indoles scilicet huius Calculi in eo confistit, vt eiusmunem. modi relatio inter binas variabiles inuestigetur, vnde vna pluresue formulae integrales nanciscantur valores fiue algebraicos, fiue datas quadraturas inuoluentes. Veluti fi talis definiri debeat relatio inter binas variabiles x et y, vt ista formula integralis: $\int \sqrt{(\partial x^2 + \partial y^2)}$, algebraicum valorem adipiscatur, vel etiam datas quantitates transcendentes inuoluat. Hinc enim euidens est curuas algebraicas obtineri, quae fint vel rectificabiles, vel quarum rectificatio a datis quadraturis pendeat; atque hinc problema illud Hermannianum celeberrimum methodo directa solutum dedi, quo requirebantur curuae algebraicae non rectificabiles, sed quarum rectificatio datas quadraturas inuolveret, in quibus tamen nihilominus vel vnus, vel duo, vel adeo quotquis voluerit arcus affignari possent absolute rectificabiles,

 $I - I + I - I - I - I - etc. = \frac{1}{2};$ prodibit hacc expression: $\frac{\Sigma}{gr} = \frac{1}{2} + \frac{1}{3}rr(I - \frac{1}{4} + \frac{1}{9} - \frac{1}{16} + \frac{1}{23} - etc.)$ $+ \frac{1}{5}r^{4}(I - \frac{1}{4^{2}} - \frac{1}{9^{2}} - \frac{1}{16^{2}} + \frac{1}{25^{2}} - etc.)$ $+ \frac{1}{7}r^{6}(I - \frac{1}{4^{5}} + \frac{1}{9^{3}} - \frac{1}{16^{3}} + \frac{1}{25^{3}} - etc.)$ etc.

Quoniam igitur harum ferierum omnium fummae funt cognitae, hinc per approximationem eo facilius valor litterae Σ definiri poterit, quia littera r femper denotat fractionem vnitate maiorem.

(46)

§. 38. Quod fi ergo in fubfidium vocemus ea quae olim circa fummas harum potestatum erueram, atque iisdem denominationibus vtamur, ponendo:

A
$$\pi^2 = \mathbf{I} + \frac{\mathbf{I}}{4} + \frac{\mathbf{I}}{9} + \frac{\mathbf{I}}{16} + \frac{\mathbf{I}}{25} + \text{etc.}$$

B $\pi^4 = \mathbf{I} + \frac{\mathbf{I}}{4^2} + \frac{\mathbf{I}}{9^2} + \frac{\mathbf{I}}{16^2} + \frac{\mathbf{I}}{25^2} + \text{etc.}$
C $\pi^6 = \mathbf{I} + \frac{\mathbf{I}}{4^3} + \frac{\mathbf{I}}{9^3} + \frac{\mathbf{I}}{16^3} + \frac{\mathbf{I}}{25^3} + \text{etc.}$
etc.

quoniam hinc facile fummae deriuantur, quando terminorum figna alternantur, habebitur:

$$\frac{\Sigma}{2r} = \frac{1}{2} + \frac{1}{3} \left(\mathbf{I} - \frac{1}{3} \right) \mathbf{A} \pi \pi r r + \frac{1}{5} \left(\mathbf{I} - \frac{1}{3} \right) \mathbf{B} \pi^{4} r^{4} + \frac{1}{7} \left(\mathbf{I} - \frac{1}{3^{2}} \right) \mathbf{C} \pi^{6} r^{6} + \text{etc.}$$

Vbí meminiffe conuenit effe

 $A = \frac{1}{6}, B = \frac{1}{90}, C = \frac{1}{943}, D = \frac{1}{9430}, E = \frac{1}{93333}$, etc. Horum autem valorum ratio iam faepius abunde eft exposita.

SPECI-
